

Skill Swap Initiative

By: Justin Kalski, Talin Keshesh, Sako Asatryan, BachViet Nguyen, Zakir Rizvi

Summary

The SkillSwap app is going to be a digital marketplace where individuals can showcase the services they offer (Java programming, photography, Gymnastic Tutoring), and connect with others who can provide services they need in return (logo design, engineering prototype). Rather than relying solely on money, the platform enables a direct exchange of skills/services, lowering financial barriers and creating more opportunities for people to get work done and collaborate. While the first users may be students, the platform is designed for everyone, encouraging collaboration across different backgrounds and interests. In addition to trading services, there is also a “learn and return” aspect, where individuals can share knowledge in one area while gaining experience in another.

Ultimately, the platform emphasizes the importance of people supporting one another, community building, and valuing human abilities over purely monetary or AI solutions.

Problem Statement

Many students (and people in general) possess skills they can share, such as tutoring, design, coding, or even music lessons, but often lack the funds to cover the expenses they incur in return. Current freelance apps mostly work around money, which doesn't always fit when you're in school or just starting.

Our SkillSwap platform will make it easier for students to trade their skills without worrying about the cost. It's about people helping each other, building connections, and getting things done together, rather than relying solely on paid services or AI tools.

Objectives and Goals

- Make it simple for users to create a profile that shows the skills they can offer and the skills they're looking to learn or get help with.
- Build a matching system that pairs people up when what one person needs matches what another person can do.
- Give students a direct way to connect, chat, and set up a swap without hassle.
- Users can leave ratings and feedback, so people know who's reliable.
